

<b>TAD BST Tree</b>
BST TREE = {a1, a2, a3 ... aN}
-a1 is the main element, a2 and a3 are subtrees of a1, any element less than a1 goes to the left, and any element to the right is greater than a1.
 <pre> graph TD     A1((A1)) --&gt; A2((A2))     A1 --&gt; A3((A3))     A2 --&gt; A4((A4))     A2 --&gt; A5((A5))     A3 --&gt; A6((A6)) </pre> <p><math>A_4 &lt; A_2 &lt; A_5 &lt; A_1 &lt; A_3 &lt; A_6</math></p>
Inv: {a1 > a2, a1 < a3} for any BST tree and sub tree, to the left of the element, elements are less than and to right of the element, elements are greater than
Primitive operations:
-createBST: ->BST -Insert: Element x BST ->BST -delete: Element x BST ->BST -search: BST ->Element -searchElement: BST ->Element

Insert(K key,E newItem) : Modifier	CreateBST() : Constructor
"Insert a new key inside the binary tree, if the key already exists, insert a new position"	"Create (initialize) a new empty Binary tree to add new elements"
<pre> { pre: Binary Tree initialized } { post: Increments the depth of the branch with +1 in this specific sub-tree } </pre>	<pre> { pre: TRUE } { post: NewTree: The new created binary tree ready to add new elements } </pre>

Delete( K key): Modifier
"Delete a specific element or key from the binary tree"
<pre> { pre: Binary Tree initialized } { post: Decrements the depth of the branch with -1 in this specific sub-tree } </pre>

Search(K key): Analyzer
"Search a specific key value inside the Binary Tree and returns it"
<pre> { pre: Binary Tree initialized } { post: Return the ArrayList of elements or return a "False" if the key don't exists } </pre>

SearchElement(K key): Analyzer
"Search a specific element with a unique key value and returns it"
<pre> { pre: Binary Tree initialized } { post: Element : The element with the specific key value, if the element don't exists, it returns False } </pre>
